Title : On the Mechanism of Acetylcholine Formation in Para-sympathetic Nerves of the Heart.

Orig Pub : Fiziol. zh. SSSR, 1957, 43, No 6, 531-537

Abstract : In frogs and cats, at various times after removal of the pancreas, in acute experiments, weakening or falling off of the inhibiting influence of the nervus vagus (NV) on the heart was observed. Addition of eserine and acetylcholine (I) to Ringer solution, rinsing the isolated heart of frog, did not restore the inhibiting effect, but a single introduction of 0.03 M of I into the blood channel restored it after 30-50 minutes. After dissection of NV, the same introduction of I does not lead to the

TITLE: Mechanism of diaphragm paralysis in botulism, tetanus, and diphtheria

SOURCE: Patologicheskaya fisiologiya i eksperimental'naya terapiya, v. 9, no. 5, 1965, 14-18

TOPIC TAGS: experiment animal, toxicology, botulism, bacterial disease

ABSTRACT: Experiments were conducted with cats poisoned with botulism, tetanus, and diphtheria toxin. The changes in the electrical activity in the central end of a phrenic nerve were similar in generalized and local forms of botulism, tetanus, and diphtheria. Local affections of the diaphragm showed a different disturbance

pattern. The botulin toxin not only suppressed the excitability of the moto-neurons, delaying the nerve impulse transmission along the phrenic nerve, but also cut out their function as trophic centers. This led to a prolapse of the peripheral neuro-muscular diaphragm apparatuses. The system of small moto-neurons, in this case, conserved its activity, and as a result there were always breathing impulses on the affected side in the central section of a divided phrenic nerve. With local affection of tetanus, the dystrophic changes in the big moto-neurons and the subsequent prolapse of "tetanic" nerve fibers developed only in the late stages of poisoning. These disturbances were absent in local diphtheria of the paralysis diaphragm. Orig. art. has: 2 tables and 1 diagram.

TITLE:

Progress in Prestressed Reinforced Concrete in USSR.
(Razvitiye predvaritel'no napryazhennogo zhelezobetona
v SSSR).

PERIODICAL: Beton i Zhelezobeton, 1957, Nr 11, pp 455-463.

ABSTRACT:

The first publications dealing with precast reinforced concrete appeared in the early thirties and were written by: V.P. Vasilevskiy, N.V. Krug, V.V. Mikhaylov and Ye.E. Mikhel'son. Figure 1 illustrates tests carried out in 1933 with tubular floor beams for 6m spans and superimposed loads of 1,400kg/m². Investigations are now carried out in Moscow by D.V. Ofrosimov, B.T. Sedel'nikov and I.G. Ivanov-Dyatlov on prestressed concrete pipes for the conveyance of fluids under pressure. The manufacturing problems were investigated by A.A. Gvozdev and S.A. Dmitriyev in the TsNIPS. The manufacture of prestressed concrete beams was commenced in 1940/41 by the Promstroyprojekt (M.G. Kostyukovsky) and by the Khar'kov

Institute of Building (S.E. Frayfel'd). Since 1941 the following scientists have been working on the application of precast reinforced concrete units for building purposes: A.A. Gvozdev, S.A. Dmitriyev, V.V. Mikhaylov, P.L. Pasternak, E.G. Patts, Yu.Ya. Shtayerman and S.I. Frayfel'd. The post-stressing of reinforced concrete bridge constructions was begun in 1956 by S.V. Brykin and A.P. Korovkin, and the method further elaborated by: I.Yu Barenboym, A.S. Bachelis, N.E. Blinkov, N.N. Bogdanov, D.A. Grigor'yev, A.P. Korovkin, V.A. Skopich, E.A. Troitskiy, M.A. Yakubovich and B.V. Yakubovskiy. In the Khar'kov Institute of Railway Engineers (V.I. Gnedovskiy), work is carried out on constructions of bridges with the use of 'open' frames. Arched constructions with rod supporting members from prestressed concrete were designed in the Tbilisi Institute of Railway Engineers (V.A. Slovinskij). Similar constructions are being designed by the Leningrad Mostostroy and the Leningrad Institute of Railway Engineers (A.S. Bachelis and V.A. Chezhin). The post-stressing of frames of industrial buildings was first used by: A.P. Vasil'yev, I.G. Lyudkovskiy and N.L. Perel'shteyn and R.G. Shishkin. N.I. Klimov of the NIIZhB designed floor panels

12m x 1.5m where the reinforcement is situated on the side of the post-tensioned slab and grouted in when two slabs are put together (Figure 2). Figure 3 illustrates a 24m long truss for industrial buildings consisting of individual prestressed parts. The following specialists were engaged on designs: G.I. Berdichevskiy, N.M. Bogin, G.V. Butberg, B.F. Vasil'yev, B.F. Goryunov, M.G. Kostyukovskiy, A.A. Svetov and K.V. Mikhayalov and those on automatic concreting plants (Figure 4): Ya L. Kaplanskiy, V.I. Ovsyankin, I.M. Ovadovskiy, A.N. Popov, V.I. Shevchenko and G.Z. Chachanidze. The following scientists are working on precast assembled constructions of industrial buildings: A.I. Avakov, G.I. Berdichevskiy, A.A. Gvozdev, A.M. Veksman, K.V. Mikhayalov, A.P. Makarov, N.M. Mullin, B.L. Sklyar and N.M. Kurek. The following engineers are specialists in the continuous prestressed reinforcement of concrete constructions: G.I. Berdichevskiy, I.I. Berger, F.E. Gitman, P.Ya D'yachenko, B.A. Kalaturov, S.A. Mirotvorskiy, A.N. Popov, A.A. Svetov, B.A. Sklyar, G.K. Khaydukov. Various prestressing machines e.g. SPV-1, SPV-3, SPV-3a, ARM, SPV-4, and ANM are described. A re-

Card 3/4

volving concreting table 'DN-5' (Figures 6 and 7) is described and illustrated. Figure 8 illustrates a new winding machine 'PM' which is similar to machine DN-5, and figure 9 a winding machine for spiral reinforcement RT-42. The apparatus DN-7 is designed for continuous reinforcement (Figure 10). Details of this machine are shown in Figure 11. The following scientists are engaged on investigations of physical, technological and chemical processes of cements: S.L. Litver, V.V. Mikhaylov, N.M. Moskvin, A.N. Popov and N.A. Rebinder. The production of high quality concretes was investigated in the TNISGEI by V.V. Mikhaylov and V.A. Slovinskiy. It was found that vibro pressing is necessary to obtain high quality concrete. The Kramatorsk factory manufactured the first vibro press designed by A.M. Gindin and V.A. Slovinskiy. There are twelve figures.

ABSTRACT: In December 1958 a session of the Commission on Prestressed and Precast Reinforced Concrete Construction was held in Moscow. This Commission was appointed by the Academy of Building and Architecture of USSR (Akademiya stroitel'stva i arkhitektury SSSR). The following papers were read:
Programmes and Planning for 1959/1965 - N.K. Proskuryakov, Director of the Department of Concrete and Reinforced Concrete Constructions of Gosstroy of USSR;
Report on the Commission's Activities in 1958 and Plans for 1959 - V.V. Mikhaylov and A.A. Gvozdev, Members of ASIA SSSR;
Reports on the Third International Congress on Prestressed Precast Reinforced Concrete - S.S. Davydov, Vice-President Card 1/2 of ASIA SSSR; V.V. Mikhaylov, Member ASIA SSSR; and
